* Explanations for species categories

Category A: At least one, apparently wild specimen of the species with one or more confirmed records from within the current borders of Romania since 1st of January 1950;

Category B: At least one, apparently wild specimen of the species was recorded inside the current borders of Romania between 1800 and 31st of December 1949;

Category C: A species with a self-sustaining breeding population in Romania or other European countries, which established with human intervention far from its natural breeding distribution range, and at least one specimen originates from such a population;

Category D*: At least one specimen of the species apparently of wild origin with one or more confirmed record since 1st January 1950 within the current borders of Romania, but their origin from a non-wild population cannot be excluded without doubt;

Category D: At least one specimen of the species apparently of wild origin with one or more confirmed record since 1st January 1950 within the current borders of Romania, but circumstances indicate that it is not probable that the specimen originated from a wild population. We consider these specimen as probable escape from captivity;

Category E: The specimen of the species recorded certainly in Romania is most probably or certainly not of wild origin, escaped from captivity. Those species are listed in this category where it is not possible that the specimens owing to their distribution can reach Romania by themselves, and in case where it is most probable or even proved that the specimens came to Romania with human intervention or from zoo.
